

## **Q) Can we write multiple catch blocks for single try block? If yes, why do we need?**

**A)** Yes, we can have multiple catch blocks for a single try block. These catch blocks are used to catch different type of exceptions so each catch block varies in the definition of exception that it catches . Out of the multiple ones only one catch block gets executed if there was any match of the exception occurred with that of it defined exception

### Syntax:

```
try
{
    ....
}
catch (Exception ex1)
{
    ....
}
catch (Exception ex2)
{
    ....
}
..
..
```
